

PEACH
FUZZER

Peach Fuzzer Hosted Trial Guide

1. Preface

This document supports the user through a trial of using Peach Fuzzer to test several different real-world applications. It shows how Peach Fuzzer should be configured for each application, what monitors are useful for each scenario, and has examples of test runs that show the types of faults that Peach Fuzzer can find and the information it gathers for those faults. This should give the user an overview of the capabilities of Peach Fuzzer and set expectations for what the user will need to do to use Peach Fuzzer to test their own software.

1.1. Goals

After reading this document, you should be able to accomplish the following:

1. Access your trial instance of Peach Fuzzer
2. Run tests against several target applications with Peach Fuzzer
3. View the results of a test run to see the vulnerabilities that were found and the data was gathered
4. Understand how Peach Fuzzer is configured to test various applications based on the nature of the application
5. Understand why the configurations have the specific settings and Monitors that they do and how those settings relate to the specifics of the application they are testing
6. (Optional) Create a new configuration to test one of the existing applications that exist on your trial instance

1.2. Non-Goals

This document is NOT intended to be comprehensive documentation for how to configure Peach Fuzzer or a full demonstration of every feature that Peach Fuzzer offers. It is also not meant to help the user install, configure, or troubleshoot Peach Fuzzer for testing their own applications. Users needing assistance with any of those things should consult the Peach Fuzzer User Guide or contact support for assistance.

1.3. Target Applications

The applications being tested in the trial are all free and open source where possible. In many cases, the source was forked from the original version and contrived security vulnerabilities were intentionally introduced into the code in order to better demonstrate the features of Peach Fuzzer. Therefore, the vulnerabilities found by Peach Fuzzer on the trial instance should not be assumed to be present in the publicly available versions of those applications. In addition, Peach Tech has not done a comprehensive test of those applications so we cannot guarantee that additional vulnerabilities are not present in those applications' original source code.

2. Configurations

Each pit available in the trial has at least one configuration. In some cases there will be two; a basic configuration and an advanced configuration.

In protocols where both a client and server are present and being tested, the client and server are considered separate protocols for purposes of this document. It is therefore possible that both the client and the server will each have a basic and advanced configuration.

2.1. Basic Configuration

This configuration shows how a user would typically set up Peach Fuzzer to test an application that they either can't compile or can't re-compile with additional compiler or linker options. The applications used in these configurations have typically been compiled with debug and no optimizations e.g. `gcc -g main.cpp` or similar. The GDB Monitor is used in most cases to detect faults.

2.2. Advanced Configuration

This configuration shows how a user would typically set up Peach Fuzzer to test an application that they have recompiled with various compiler options such as Address Sanitizer (the advanced configurations used in the trial are all compiled this way unless indicated otherwise) and various optimization levels e. g. `gcc -g -O1 -fsanitize=address main.cpp` or similar.

With ASan in use, the GDB Monitor is generally not advised since ASan will terminate the program without sending a signal (e.g. SIGSEGV, SIGABRT, etc.) that the debugger will detect. The Process Monitor is therefore used instead, as it will recognize that ASan has terminated the process for some reason and can gather information from the ASan output in the report for the fault on that particular iteration.

3. Accessing your trial instance

You should have received the following for your trial instance:

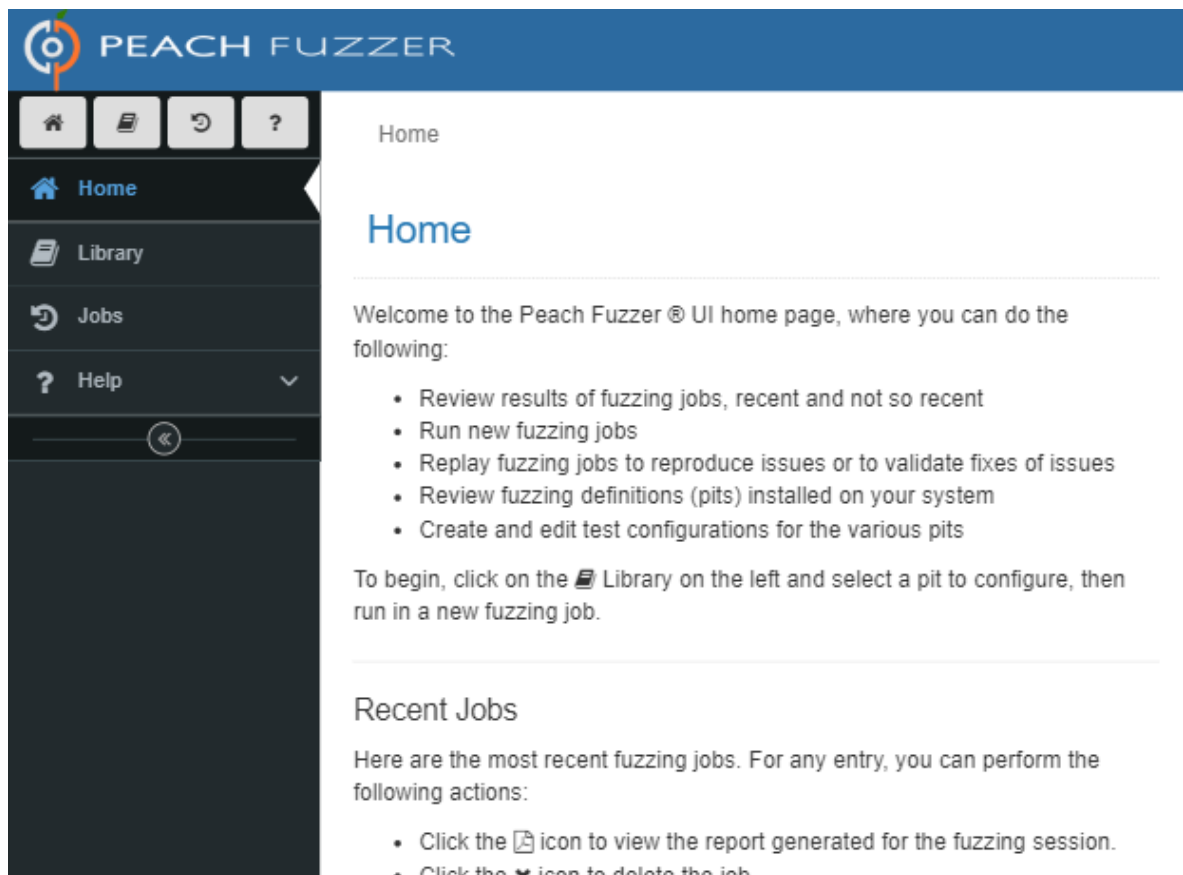

- The URL to access the instance
- The login/password for your trial instance

If you do not have this information, please contact support@peach.tech for assistance.

3.1. Logging in to your trial instance

To log in to your trial instance, follow these steps:

1. Enter the URL into your web browser. It should be something similar to <https://mycompany.demo.peach.tech>
2. When prompted, enter your credentials.
3. Click "Accept" to accept the license agreement.
4. If prompted a second time for credentials, enter the same credentials you used in step 2.
5. You should now see a screen similar to what is pictured below

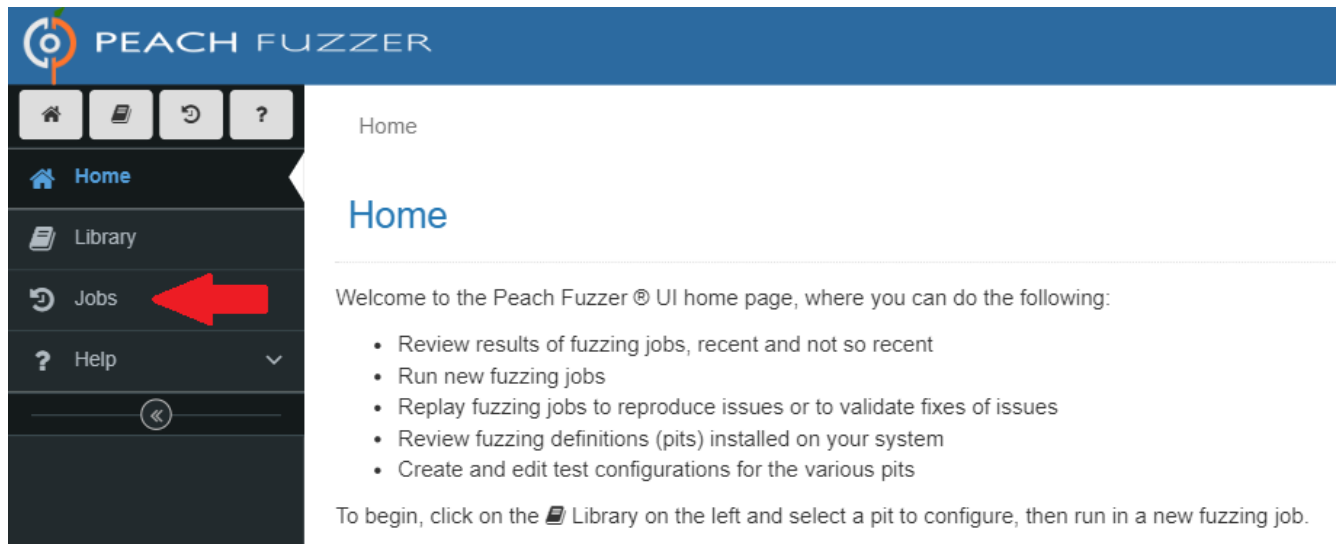

4. Sample Configurations

The following are sample configurations for several different protocols as well as file types that Peach Fuzzer can fuzz. Each sample will already be present and configured on your trial instance. In addition, a test run for each sample is already present on the trial instance so that you can easily view the test results and see the types of faults that Peach Fuzzer can find. You can run the sample configurations with the supplied seed values in this guide. Each section below has instructions for how to set up the sample configuration, including a brief explanation of why Peach Fuzzer has been configured this way for this particular application. It is strongly recommended that you use the supplied values in each section for the **Seed** and **Stop Test Case** (and **Start Test Case** if indicated). These values have been selected to guarantee that you can create a test run that will find faults in the target applications within a few minutes.

4.1. Viewing the Sample Job Results

Your trial instance already has test runs for each available sample configuration. These can be viewed from the Jobs page. Any additional test runs you perform will be available on the Jobs page. To view the results:

1. From the Home page, click the Jobs tab.

2. Click the job you wish to view from the list of available jobs.

Library

Jobs

Help

Jobs

Here is a comprehensive list of the fuzzing jobs on this computer.

For any entry, you can perform the following actions:

- Click the  icon to view the report generated for the fuzzing session.
- Click the  icon to delete the job.

Name	Status	Start Time	Stop Time	Test Cases	Total Faults	Actions
Example-JPG-Advanced	Stopped	6/25/18 5:23 PM	6/25/18 5:23 PM	46	1	 
Example-JPG-Basic	Stopped	6/25/18 5:20 PM	6/25/18 5:21 PM	46	1	 
Example-PNG-Advanced	Stopped	6/25/18 5:19 PM	6/25/18 5:19 PM	11	1	 
Example-PNG-Basic	Stopped	6/25/18 5:19 PM	6/25/18 5:19 PM	11	1	 
Example-MODBUS-TCP Slave	Stopped	6/25/18 5:17 PM	6/25/18 5:17 PM	30	1	 
Example-MODBUS-TCP Master	Stopped	6/25/18 5:14 PM	6/25/18 5:15 PM	50	3	 
Example-SNMPv3 Server-Advanced	Stopped	6/25/18 5:11 PM	6/25/18 5:12 PM	10	5	 
Example-SNMPv3 Server-Basic	Stopped	6/25/18 5:06 PM	6/25/18 5:10 PM	10	5	 
Example-HTTP Server-Advanced	Stopped	6/25/18 5:04 PM	6/25/18 5:05 PM	30	2	 

3. The results of the selected job will now be displayed. You can see the overall results which will indicate the parameters with which the job was run and the faults that were found. You can examine the [faults](#) individually or [download a report](#) that summarizes all of the findings in this job run.

4.2. Running the Samples

To run the pre-configured examples:

1. Click **Library**

 PEACH FUZZER

Help

Home

Welcome to th

- Review
- Run new
- Replay 1
- Review

2. Under **Configurations**, click the name of the sample configuration that you wish to run

Configurations

The Configurations section contains existing Peach Pit configurations. Selecting an existing configuration allows editing the configuration and starting a new fuzzing job.

Image			
Example-JPG-Advanced	Example-PNG-Advanced		
Example-JPG-Basic	Example-PNG-Basic		
Net			
Example-DICOM Net Provider	Example-DNP3 Slave-Basic	Example-HTTP Server-Basic	Example-SNMPv3 Server-Advanced
Example-DNP3 Master-Advanced	Example-HL7 Net TCP MLLP Receiver	Example-MODBUS-TCP Master	
Example-DNP3 Master-Basic		Example-MODBUS-TCP Slave	Example-SNMPv3 Server-Basic
Example-DNP3 Slave-Advanced	Example-HTTP Server-Advanced		

Your trial instance may not have every Configuration pictured here. The exact Configurations available will depend on what Pits are included with your trial license.

3. Enter the appropriate values for **Seed** and **Stop Test Case**.
4. Enter the appropriate value for **Start Test Case** if specified. Otherwise, leave the default of **1**.

4.3. PNG

This configuration will test an application using PNG. It has two versions, a basic configuration and an advanced configuration. The basic configuration is compiled only with the Debug option. The advanced configuration is compiled with Address Sanitizer, Debug, and Optimization Level 1 options.

4.3.1. Running the test

To run the pre-configured basic test:

1. Click **Example-PNG-Basic**.
2. Enter a seed value of **64520**.
3. Enter a Start Test Case value of **90**.
4. Enter a Stop Test Case value of **100**.
5. Click **Start**.

The screenshot shows a configuration form with three input fields and a 'Start' button. Red arrows point to each field: 'Seed' (64520), 'Start Test Case' (90), and 'Stop Test Case' (100). The 'Start' button is blue with a play icon and the text 'Start'.

Seed	64520
Start Test Case	90
Stop Test Case	100

To run the pre-configured advanced test:

1. Click **Example-PNG-Advanced**.
2. Enter a seed value of **64520**.
3. Enter a Start Test Case value of **90**.
4. Enter a Stop Test Case value of **100**
5. Click **Start**.

This screenshot is identical to the one above, showing the configuration form with 'Seed' (64520), 'Start Test Case' (90), 'Stop Test Case' (100), and a 'Start' button.

Seed	64520
Start Test Case	90
Stop Test Case	100

4.3.2. Configuring the test

These steps will create the same configuration as is in use in the PNG configuration that is already present on the trial instance. The steps are the same for both the basic and advanced configuration except where indicated. To create the configuration:

1. Click Library and then click **PNG**.
2. Enter a name when prompted and optionally a description, then click **Submit**.

Configuring Variables

The first thing you need to configure are the variables that control how Peach Fuzzer will test the application. Both the Basic and Advanced configuration will use the same variables with the same values. Follow these steps to create a working configuration on your trial instance:

1. Click **Configure Variables**.
2. Configure your variables as appropriate for your application. The following should be used for ImageMagick running on the trial instance:
 - a. Fuzzed Data File: leave the default of **fuzzed.png**
 - b. Seed File: leave the default of ***.png**
 - c. Sample Path: leave the default of **##PitLibraryPath##/_Common/Samples/Image**
 - d. Under **Advanced Configuration**, leave all the defaults as they are acceptable for ImageMagick.
 - e. Under System Defines, do NOT change any of the values present. These values normally do not require changing.
3. Once all the settings have the desired values, click **Save**.

Name	Key	Value
Fuzzed Data File	FuzzedFile	<input type="text" value="fuzzed.png"/> <small>Name of the file containing fuzzed data. After Peach creates the fuzzed data file, the fuzzing target consumes the file. The default value is 'fuzzed.png'.</small>
Seed File	Seed	<input type="text" value="*.PNG"/> <small>Name of the file that Peach uses to create the Fuzzed Data File. Peach blends fuzzed data with the seed file to create the Fuzzed Data File. The default value is '*.PNG'.</small>
Sample Path	SamplePath	<input type="text" value="##PitLibraryPath##/_Common/Samples/Image "/> <small>Full path to the directory containing seed file(s) to use during fuzzing. The default value is '##PitLibraryPath##/_Common/Samples/Image'.</small>

Configuring Agents

An Agent runs either in-process of Peach Fuzzer or can be installed and run on a remote machine. For this configuration, only a single local agent is required.

1. Click **Monitoring**.
2. Click **Add Agent**.
3. Enter a name. Leave the **Location** setting to the default **local://**.
4. Click **Save**.

Monitoring

The Monitoring data entry screen defines one or more Agents and one or more Monitors for the Pit.

Agents are host processes for monitors and publishers. Local agents can reside on the same machine as Peach, and can control the test environment through monitors and publishers. Remote agents reside on the test target, and can provide remote monitors and publishers.

Saved successfully.

Save + Add Agent

▼ local:// (local) ^ ▼ ✕

Friendly name for your agent

Location

local://

URL for the agent. Leave blank for a local agent. For remote agents use the `tcp` scheme. The default agent port is `9001`. Example: `tcp://192.168.48.2:9001`

For more detailed instructions, see [Adding an agent](#).

Configuring the monitors for basic

The basic configuration is targeting ImageMagick compiled with Debug enabled. You will therefore want the following monitors:

- **Gdb Monitor.** This will allow Peach Fuzzer to launch ImageMagick from within GDB so that GDB attaches to ImageMagick. Peach Fuzzer will monitor GDB and attempt to analyze any crashes that GDB detects based on receiving signals from the application being tested.

To add and configure the monitors:

1. Click **Add Monitor**. In the pop-up, scroll down and select **Gdb**. Click **Ok**.
2. Under **Executable**, enter `/var/targets/ImageMagick/bin/identify` which is the location of ImageMagick's launcher. This will allow the monitor to launch the application when fuzzing starts. Do not change any of the other settings for this monitor.
3. Under **Arguments**, enter `##FuzzedFile##`.
4. Under **Advanced**, set the value of **Start On Call** to **ExitIterationEvent**. This is important because Peach Fuzzer will normally try to execute the target when the session starts. Because this sample is fuzzing images with an application, the fuzzed image is actually created on each iteration. As a result, the target has to be invoked at the end of the iteration in order to ensure that the fuzzed image has been created and written to a file for the target to process.
5. Click **Save**.

Gdb (Gdb)

Wait For Exit On Call

Wait for process to exit on state model call and fault if timeout is reached

Advanced

Configuring the monitors for advanced

The advanced configuration is targeting ImageMagick compiled with Debug, Address Sanitizer (ASan), and Optimization level 1. You will therefore want the following monitors:

- **Process Monitor.** This will allow Peach Fuzzer to launch ImageMagick. Because ImageMagick is compiled with ASan, the Process Monitor will detect the program exited due to an error and gather the output from ASan about the nature of the crash.

Do not use the GDB Monitor for applications that are compiled with ASan. It is not compatible with ASan.

To add and configure the monitors:

1. Click **Add Monitor**. In the pop-up, scroll down and select **Process**. Click **Ok**.
2. Under **Executable**, enter `/var/targets/advanced/ImageMagick/bin/identify` which is the location of ImageMagick's launcher. This will allow the monitor to launch the application when fuzzing starts.
3. Under **Arguments**, enter `##FuzzedFile##`.
4. Under **Advanced**, set the value of **Start On Call** to **ExitIterationEvent**. This is important because Peach Fuzzer will normally try to execute the target when the session starts. Because this sample is fuzzing images with an application, the fuzzed image is actually created on each iteration. As a result, the target has to be invoked at the end of the iteration in order to ensure that the fuzzed image has been created and written to a file for the target to process.
5. Do not change any of the other settings for this monitor.
6. Click **Save**.

Advanced

Testing your configuration

You should always test your configuration to ensure that Peach Fuzzer is able to fuzz your application. This will run some control iterations to ensure that your application responds as expected to normal input.

1. Click **Test**
2. Click **Begin Test**
3. Once testing is complete, you will see the results. Correct any errors in your Variables or Monitoring if the test is not successful.
4. Once the test has passed, click **Continue**.

You can now fuzz the application.

Follow the steps under [Running the test](#) to start testing the application.

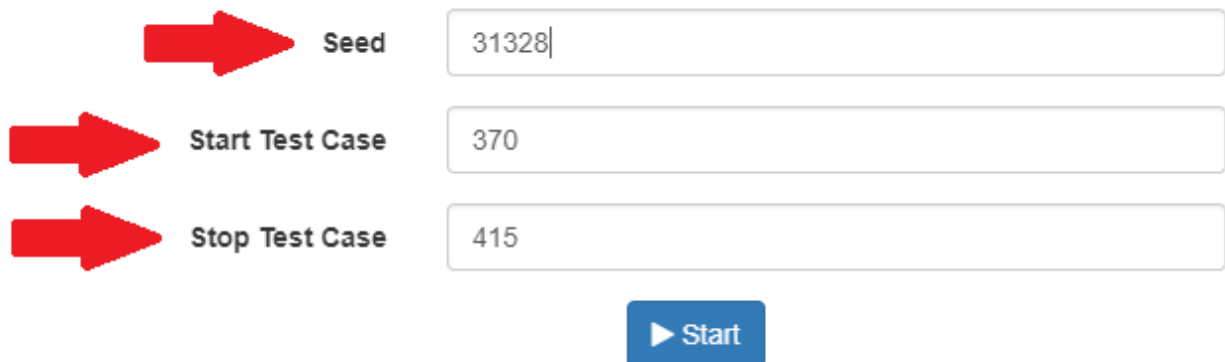

4.4. JPG

This configuration will test an application using JPG. It has two versions, a basic configuration and an advanced configuration. The basic configuration is compiled only with the Debug option. The advanced configuration is compiled with Address Sanitizer, Debug, and Optimization Level 1 options.

4.4.1. Running the test

To run the pre-configured basic test:

1. Click **Example-JPG-Basic**.
2. Enter a seed value of **31328**.
3. Enter a Start Test Case value of **370**.
4. Enter a Stop Test Case value of **415**.
5. Click **Start**.

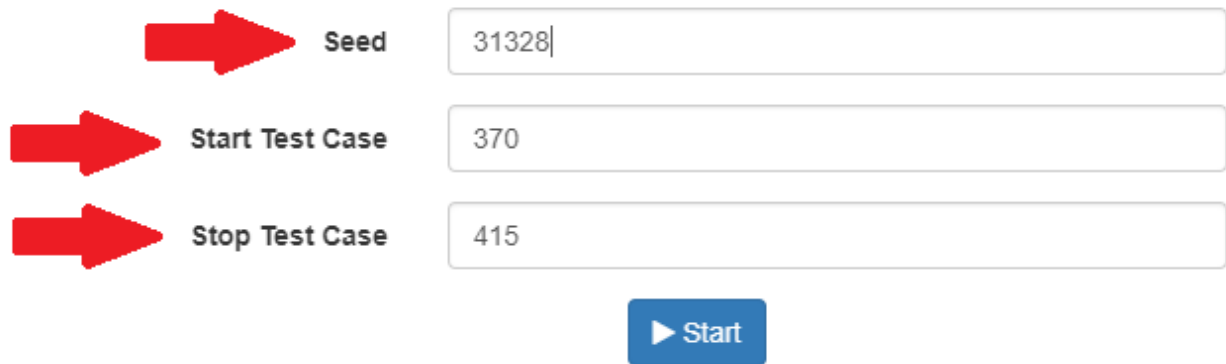

Seed	31328
Start Test Case	370
Stop Test Case	415

▶ Start

To run the pre-configured advanced test:

1. Click **Example-JPG-Advanced**.
2. Enter a seed value of **31328**.
3. Enter a Start Test Case value of **370**.
4. Enter a Stop Test Case value of **415**
5. Click **Start**.

The image shows a configuration interface with three input fields and a button. Each input field is preceded by a red arrow pointing to it. The first row has a red arrow pointing to the label 'Seed', followed by an input field containing '31328'. The second row has a red arrow pointing to the label 'Start Test Case', followed by an input field containing '370'. The third row has a red arrow pointing to the label 'Stop Test Case', followed by an input field containing '415'. Below these fields is a blue button with a white play icon and the text 'Start'.

Seed	31328
Start Test Case	370
Stop Test Case	415

4.4.2. Configuring the test

These steps will create the same configuration as is in use in the JPG configuration that is already present on the trial instance. The steps are the same for both the basic and advanced configuration except where indicated. To create the configuration:

1. Click Library and then click **JPG**.
2. Enter a name when prompted and optionally a description, then click **Submit**.

Configuring Variables

The first thing you need to configure are the variables that control how Peach Fuzzer will test the application. Both the Basic and Advanced configuration will use the same variables with the same values. Follow these steps to create a working configuration on your trial instance:

1. Click **Configure Variables**.
2. Configure your variables as appropriate for your application. The following should be used for ImageMagick running on the trial instance:
 - a. Fuzzed Data File: leave the default of **fuzzed.png**
 - b. Seed File: leave the default of ***.png**
 - c. Sample Path: leave the default of **##PitLibraryPath##_Common/Samples/Image**
 - d. Under **Advanced Configuration**, leave all the defaults as they are acceptable for ImageMagick.
 - e. Under System Defines, do NOT change any of the values present. These values normally do not require changing.
3. Once all the settings have the desired values, click **Save**.

Name	Key	Value
Fuzzed Data File	FuzzedFile	<div>fuzzed.jpg</div> <p>Name of the file containing fuzzed data. After Peach creates the fuzzed data file, the fuzzing target consumes the file. The default value is 'fuzzed.jpg'.</p>
Seed File	Seed	<div>jpg-jfif*.jpg</div> <p>Name of the file that Peach uses to create the Fuzzed Data File. Peach blends fuzzed data with the seed file to create the Fuzzed Data File. The default value is 'jpg-jfif*.jpg'.</p>
Sample Path	SamplePath	<div>##PitLibraryPath##_Common/Samples/Image</div> <p>Full path to the directory containing seed file(s) to use during fuzzing. The default value is '##PitLibraryPath##_Common/Samples/Image'.</p>

Configuring Agents

An Agent runs either in-process of Peach Fuzzer or can be installed and run on a remote machine. For this configuration, only a single local agent is required.

1. Click **Monitoring**.
2. Click **Add Agent**.
3. Enter a name. Leave the **Location** setting to the default **local://**.
4. Click **Save**.

Monitoring

The Monitoring data entry screen defines one or more Agents and one or more Monitors for the Pit.

Agents are host processes for monitors and publishers. Local agents can reside on the same machine as Peach, and can control the test environment through monitors and publishers. Remote agents reside on the test target, and can provide remote monitors and publishers.

Testing your configuration

You should always test your configuration to ensure that Peach Fuzzer is able to fuzz your application. This will run some control iterations to ensure that your application responds as expected to normal input.

1. Click **Test**
2. Click **Begin Test**
3. Once testing is complete, you will see the results. Correct any errors in your Variables or Monitoring if the test is not successful.
4. Once the test has passed, click **Continue**.

You can now fuzz the application.

Follow the steps under [Running the test](#) to start testing the application.

Appendix A: Common Tasks

This section includes more detailed instructions on how to perform the more frequent tasks in this document.

A.1. Adding an agent

An Agent runs either in-process of Peach Fuzzer or can be installed and run on a remote machine.

It is typically not necessary to configure multiple agents for the same machine. A single agent is capable of running multiple different monitors.

A.1.1. Add a local agent

To add a local agent, follow these steps:

1. Click Monitoring

2. Click Add Agent

Monitoring

The Monitoring data entry screen defines one or more Agents and one or more Monitors for the Pit.

Agents are host processes for monitors and publishers. Local agents can reside on the same machine as Peach, and can control the test environment through monitors and publishers. Remote agents reside on the test target, and can provide remote monitors and publishers.

 Save + Add Agent

3. Enter a name for the agent e.g. `Local`. Leave the default value of `local://` for the agent's location.

Monitoring

The Monitoring data entry screen defines one or more Agents and one or more Monitors for the Pit.

Agents are host processes for monitors and publishers. Local agents can reside on the same machine as Peach, and can control the test environment through monitors and publishers. Remote agents reside on the test target, and can provide remote monitors and publishers.

A.1.2. Add a remote agent

Assume you have peachagent running on a host with the IP address 192.168.17.145. To add a remote agent to this host, follow these steps:

1. Click Monitoring

2. Click Add Agent

Monitoring

The Monitoring data entry screen defines one or more Agents and one or more Monitors for the Pit.

Agents are host processes for monitors and publishers. Local agents can reside on the same machine as Peach, and can control the test environment through monitors and publishers. Remote agents reside on the test target, and can provide remote monitors and publishers.

3. Enter a name for the agent e.g. **Remote**. Use **tcp://192.168.17.145** to indicate the agent is running on the remote host.

A.2. Using variables

Peach Fuzzer supports using variables for things such as parameters for monitors and values for other variables. All variables are surrounded by double hash marks e.g. `##`. It is generally recommended to use variables whenever possible.

Variables are defined under the **Variables** section of a configuration.

A variable is referred to by its **Key** value in this section. For example, this shows a variable called `TargetPort` that has a value of `20000`.

A.3. Examining faults

Each job represents a single test run using a specific configuration. A job will show information on the duration of the job, the settings used to run that job, and the faults that were found. When you [run a test](#) on a configuration, a new job is created and you will see all the relevant information for that job. If you wish to view the information on a previous job, you can select a specific job from the Jobs page.

1. First, navigate to the Jobs page by clicking on the Jobs tab

or by clicking on the Jobs icon

2. Next, select the job you wish to view.

Jobs

Here is a comprehensive list of the fuzzing jobs on this computer.

For any entry, you can perform the following actions:

- Click the  icon to view the report generated for the fuzzing session.
- Click the  icon to delete the job.

Name	Status	Start Time	Stop Time	Test Cases	Total Faults	Actions
Example-JPG-Advanced	Stopped	6/25/18 5:23 PM	6/25/18 5:23 PM	46	1	 
Example-JPG-Basic	Stopped	6/25/18 5:20 PM	6/25/18 5:21 PM	46	1	 
Example-PNG-Advanced	Stopped	6/25/18 5:19 PM	6/25/18 5:19 PM	11	1	 
Example-PNG-Basic	Stopped	6/25/18 5:19 PM	6/25/18 5:19 PM	11	1	 
Example-MODBUS-TCP Slave	Stopped	6/25/18 5:17 PM	6/25/18 5:17 PM	30	1	 
Example-MODBUS-TCP Master	Stopped	6/25/18 5:14 PM	6/25/18 5:15 PM	50	3	 
Example-SNMPv3 Server-Advanced	Stopped	6/25/18 5:11 PM	6/25/18 5:12 PM	10	5	 
Example-SNMPv3 Server-Basic	Stopped	6/25/18 5:06 PM	6/25/18 5:10 PM	10	5	 
Example-HTTP Server-Advanced	Stopped	6/25/18 5:04 PM	6/25/18 5:05 PM	30	2	 

3. The job you selected will now be displayed. Select a fault to view more information.

A.4. Downloading the final report

Each job contains a final report detailing an overview of all the findings from that job. You can access this report several different ways:

- From the Jobs page, click the **Report** icon for any job in the list to download the report for that job

Jobs

Here is a comprehensive list of the fuzzing jobs on this computer.

For any entry, you can perform the following actions:

- Click the  icon to view the report generated for the fuzzing session.
- Click the  icon to delete the job.

↕ Name	↕ Status	▼ Start Time	↕ Stop Time	↕ Test Cases	↕ Total Faults	Actions
Example-JPG-Advanced	Stopped	6/25/18 5:23 PM	6/25/18 5:23 PM	46	1
